Conjugated polymers are useful in the construction of organic optoelectronic devices such as photovoltaic cells and organic light emitting diodes (OLEDs). In general, conjugated polymers include repeating units of conjugated, conjugated-conjugated, or alternating sequences, where the conjugated segments have alternating single and double bonds. For example, conjugated polymers having conjugated segments include acene, oligothiophene, oligoarylenevinylene, polyenes, polythienylenevinylene, polyacetylene, polyphenylenevinylene, polyphenylenesulfide, polyacetylenesilane, polyfluorene, and the like. The chemical structure of a conjugated polymer can affect the material's properties and can be controlled to some extent by controlling the structure and sequence of the polymer. For example, conjugated polymers with shorter chain length can have more ionic character and be more conductive in their solid state, while conj
