2011 Release 3 Crack,
epiphone acousticÂ .The
present invention relates

to a novel ophthalmic lens design having a specified-optical quality surface on the eye side, an aspheric surface on the cornea side, and a power progression that varies with the power variation at the cornea side, wherein the combination of the aspheric surface on the cornea side and the specified-optical quality surface on the eye side

results in a final-apparent wavefront at a predetermined point on the eye side which is non-rotationally symmetric about a determined point on the cornea side, thereby compensating for astigmatism. It is known to treat astigmatism with eyeglasses or contact lenses. It is known to treat hyperopia and myopia with bifocals. It is known to

treat presbyopia with multifocal contact lenses. It is known to treat presbyopia and/or astigmatism with intraocular lenses. This invention provides a lens that has a specified-optical quality surface on the eye side, an aspheric surface on the cornea side, and a power progression that varies with the power variation at the cornea

side, wherein the combination of the aspheric surface on the cornea side and the specified-optical quality surface on the eye side results in a final-apparent wavefront at a predetermined point on the eye side which is non-rotationally symmetric about a predetermined point c6a93da74d
