Simply right-click the web page on your desktop, and choose "Save link as.". Features. Mikro PC 4.2.2 full version free download ldap serverQ: Google App Engine Memory: standard vs large, fastest I have a question. I need to calculate a Trie and keep it in RAM or, if its too big, on the disk. I thought about two things for memory usage: Small Having a dictionary with 10 million entries in RAM. This is 15 MBs. Large Having a dictionary with 10 million entries in RAM and on the disk. This is 100MBs. It should be faster if it is on the disk, right? But why? A: This is from Google App Engine Python dictionary documentation: The dictionary type is typically the fastest to use because it implements most of the functionality of a full-featured dictionary class with just the simplest of storage requirements. The library chooses an appropriate subclass of dict when the number of keys is large, typically in the range [1,10) or so; the numbers in the documentation above are not such limiting values and are a product of the memory limitations of the Java virtual machine. Also, in App Engine, the default datastore is the memcache which has limitations about the size of datastore: The limit on the maximum size of a Datastore entity's value is currently 10MB. A limit of 5MB will be added to this limit in a future release. This applies to TEXT, BLOB and ARRAY types, as well as the JSON datastore-encoded value. And these were the c6a93da74d
